

XDP<sup>™</sup> digital power

### About this document

### Scope and purpose

The purpose of this document is to give a quick guide to operation of the XDPL8220 reference board for all power classes of LED lighting applications, and how to use the .dp Vision software to program the operating parameters of the digital controller XDPL8220.

### **Intended audience**

This document is intended for anyone who wants to evaluate the XDPL8220 reference design for LED lighting.

**Getting started** 

### 2 Getting started

Attention: The instructions of this manual work without VAC connection.

Attention: Before you connect the reference board to the mains, pay careful attention to the safety hints in the recent "REF-XDPL8220-U50W Engineering report Vx.x". Incorrect use of the reference board could be dangerous, even life-threatening.

### 2.1 Hardware connection

Connect the .dp Interface Gen2 to a notebook/PC with the USB cable.

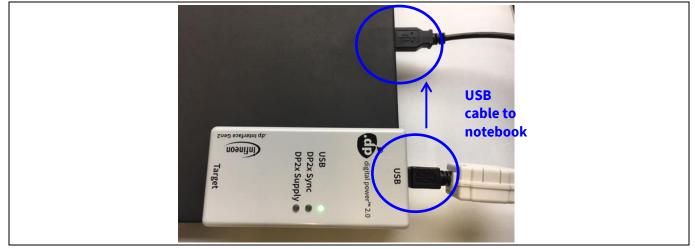

Figure 1 Connection between .dp Interface Gen2 and notebook

Note: Sometimes the detection of the .dp Interface Gen2 fails on USB3.0 ports. Therefore the use of a USB2.0 port might be necessary (which can be provided by an external USB2.0 hub if the machine only offers USB3.0 ports).

### **Getting started**

Connect the .dp Interface Gen2 to the XDPL8220 reference board with the programming cable.

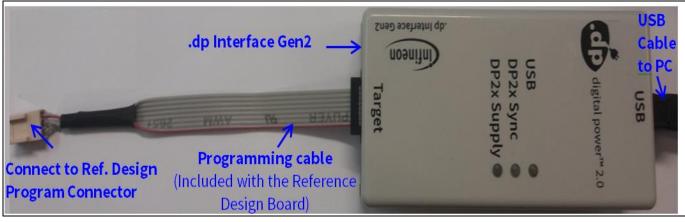

Figure 2 .dp Interface Gen2 connection

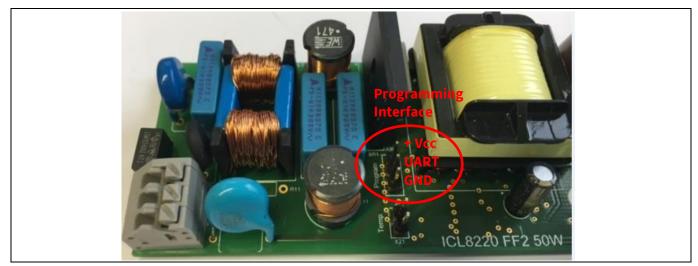

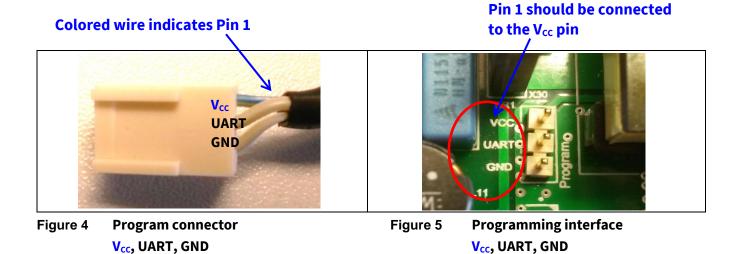

Figure 3 Connection between the .dp Interface Gen2 and the XDPL8220 reference board

*Note:* Please ensure that the connector of the programming cable is plugged in correctly: the colored wire indicates Pin 1 and should be connected to the V<sub>cc</sub> pin on the XDPL8220 reference board.

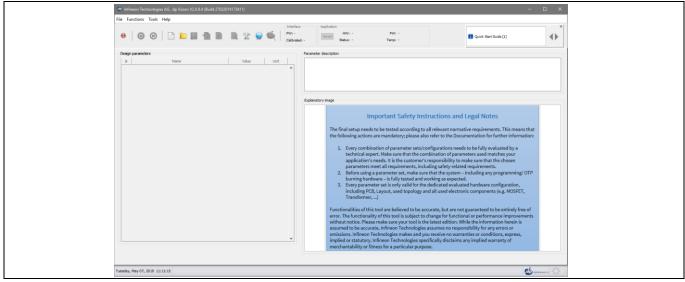

User Manual

### Getting started

### 2.2 Parameter configuration

Start the .dp Vision program by clicking the ".dp Vision" shortcut on the desktop. The screen shown in Figure 5 will appear.

Load the XDPL8220 parameters configuration file (\*.csv) in the folder (*HOME*) \*Infineon Technologies AG*\.*dp* vision\*Parameters* as shown in **Figure 7**. Please select the corresponding file (e.g., for a 50 W board choose the "XDPL8220\_FWvx.x.x\_50W" file).

### Select the appropriate .csv file to open

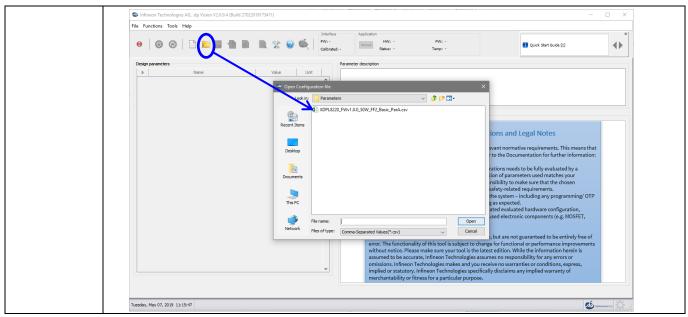

Figure 6 Load the .csv file

After loading the parameters .csv file, a list of XDPL8220 configurable parameters will show (see the box on the left in **Figure 7**). These values can be modified by users and will turn blue.

### **Getting started**

List of configurable parameters

Figure 8 Message description

### **Getting started**

There are two options available to configure the IC based on the parameter values in .dp Vision.

- 1) Non-permanent for testing
- 2) Permanent for regular operation

### 1) Test configuration

This function will download the parameter values from .dp Vision into the XDPL8220 RAM memory space, and it will then be followed by an automatic IC start-up for application testing with the new configuration. As long as the board is activated, the  $V_{cc}$  is supplied.

Parameter configuration with this option is not permanent, because the loaded RAM content gets lost once the IC supply voltage is turned off or the IC restarts due to certain protections. For detailed information, please refer to the "dpvision User manual" in the "Documents" folder.

**Table 2** shows the procedures for using the test configuration function in .dp Vision to load the new parameter values in the RAM and test the application with the new configuration.

Step	Instruction	
1	Open configuration file and change parameter value (see example in <b>Figure 7</b> ).	
2	Ensure that the primary supply voltage (AC input) to the board is not active and the hardware connection for configuration is OK based on <b>Figure 2</b> and <b>Figure 3</b> .	
3	Press 🕘 to supply power and establish a connection to the target XDPL8220. After this, XDPL8220 will be in configuration mode and the device status \varTheta should change to .	
4 (optional)	Ensure that the LED output is connected to a load, and switch on AC input (e.g. 230 V AC). After this, the board will not start because XDPL8220 is still in configuration mode.	
5	Press       to test the configuration with target XDPL8220.         After this, the IC will automatically start normal operation with the new configuration and the window below will pop up:         Image: Configuration of the window below will pop up:         Image: Configuration of the window below will pop up:         Image: Configuration of the window below will pop up:         Image: Configuration of the window below will pop up:         Image: Configuration of the window below will pop up:         Image: Configuration of the window below will pop up:         Image: Configuration of the window below will pop up:         Image: Configuration of the window below will pop up:         Image: Configuration of the window below will pop up:         Image: Configuration of the window below will pop up:         Image: Configuration of the window below will be block with the application has started         Image: Configuration of the window below will be block with the application has started         Image: Configuration of the window below will be block with the pop up block withe pop up block withe pop up block with the po	
6	Press "Close" on the pop-up window.	
7	To test another configuration, repeat these steps.	

### Table 2Test configuration procedures

Note: If there is any error between steps 1 and 7, refer to the message bar of .dp Vision for the error message. For further information, please refer to the "dpvision User manual".

### **Getting started**

### 2) Burn configuration

As the XDPL8220 chip on the 50 W reference design PCB has a first full set of parameters in its One-Time Programmable (OTP) memory space, only changed parameters are written in the OTP memory. For detailed information, please refer to the "dpvision User manual" in the "Documents" folder.

Table 3 shows the procedures to burn a parameter update in .dp Vision into the OTP memory.

Table 3	Burn configuration procedures	
Step	Instruction	
1	Load configuration file (see example in <b>Figure 7</b> ).	
2	Modify the parameter value needed, then press <b>[File]</b> >> <b>[Save]</b> or <b>[File]</b> >> <b>[Save as]</b> to save the configuration file. Otherwise, proceed to step 3.	
3 (optional)	Disconnect or turn off AC input voltage and check the hardware connection for configuration, see <b>Figure 2</b> and <b>Figure 3</b> .	
4	Press 🕘 to supply power and establish connection to the target XDPL8220. After this, XDPL8220 will enter configuration mode and the device status 🥯 should change to 🌖.	
5	<text><text><image/><image/></text></text>	
6	Press "Proceed" or "Yes" to burn the configuration. After this, a window pops up indicating success.	
7	Press "OK" on the pop-up window then disconnect the programming cable from the board connector and test the application, if needed.
